

Molecular Sieves 5A

Molecular Sieve 5A is an alkali aluminosilicate; it is the calcium form of the Type A crystal structure. Type 5A has an effective pore opening of 5 angstroms (0.5 nm). It will adsorb molecules with a kinetic diameter of less than 5 Angstrom and exclude molecules larger than 0.5nm. It is especially suitable for PSA adsorber applications where it may be used for the separation of normal- and iso-paraffins (C4 to C6 species), in PSA hydrogen purification and in oxygen concentrators.

Recommended Application

1. The strong ionic forces of the divalent calcium ion makes it an excellent adsorbent to remove water, CO₂, H₂S from sour natural gas streams, while decreasing COS formation. It can also adsorbs light mercaptans.
2. It is also used for the separation of normal- and iso-paraffins.
3. Production of high purity N₂, O₂, H₂ and inert gases from mixed gas streams.

Packing:

55 gallon air-tight iron drum,

※Other packing according to your requirement.
